Gabriel Announces the Gabriel 2.0 Emergency Response Platform

Today, a cutting-edge technology firm has created a groundbreaking technological solution to mitigate harm and provide a meaningful response to mass shootings.

Detroit, MI: Gabriel Networks today announces the release of Gabriel 2.0, the first unified platform utilizing detection technology, live video, and an automated 'call for help' process to combat the rise of active shooter events occurring in the U.S.

Using the latest AI detection technology, the solution instantly sends automated alerts with live video, controls access, and initiates security protocols when a threat is detected (weapon, gunshot, fight, robbery, etc). Within seconds, first responders have real time intelligence with eyes and ears on the scene with the ability to command and control the incident.

Taking an agnostic approach to technology, Gabriel's solution integrates with many of the industry leading products in the video surveillance, detection analytics, and access control space. "With this game changing technology, we can now solve a number of emergency response problems such as human indecision, delayed calls to 911, and misinformation." says Yoni Sherizen, CEO at Gabriel. "This saves valuable response time and it saves lives."

Features and benefits of Gabriel 2.0 include.

- Detecting threats such as weapons, fights, gunshot, and intrusion
- Automating the 'call for help' process by eliminating human indecision
- Leveraging live video to provide clear vision for a targeted response

Gabriel 2.0 will be available starting today using a subscription pricing model. For more information, visit www.gabrielprotects.com
